

Step 1 Create Mixture

Take a pop (plaster of Paris), calcium carbonate and other additives like whitening agents or coloring agents and mix the entire ingredient with water to make uniform paste mixture

A good quality mixture is required to make brittle chalk for smooth writing so you need to be careful while making a mixture for chalk

Step 2 Mold Lubrication

Use the lubrication liquid on mold, so chalk does not stick to the mold while removing it from the mold

Lubricant consist of Groundnut oil and Kerosene and in ratio 1: 4, or you can use cooking oil as a lubricant

Step 3 Pour The Mold

Pour the mixture of POP (plaster of Paris) and calcium carbonate in the chalk mold

Allow it for 10 to 15 minutes to solidify

Step 4 Collect The Chalks

Once the mixture is solidified, open the mold and collect the chalk from the mold, remove extra material from chalk

Step 5 Keep It For Drying

After removing chalk from mold keep it in sunlight to dry for 1 to 2 days

Step 6 Packaging

Once you have done with the chalk making process you need to pack the chalk for selling and transportation

You can pack the chalk on the carton box on which you can print your brand and other information that will attract the customers
